Title (maximum 50 words)				
Critical values for Rasch item fit statistics				
Structured abstract (maximum 350 words)				
Item fit statistics are very frequently reported in Rasch analysis. Many of them have an unknown asymptotic distribution and their interpretation rely on rules-of-thumb. Extensive simulation studies have shown that it is not possible to provide a single critical value that will apply in all settings. This is a problem for all Rasch validation studies that relies on proprietary software. We introduce an easy-to-use software application that will help in establishing critical values on a case by case basis.
